## **Quantel announces support for LightSpace CMS**

**Light Illusion color management system provides color calibrated loop for Quantel users**

**IBC, Amsterdam, 10 September 2010:** Quantel announced today that it has integrated technology partner Light Illusion's LightSpace CMS (color management system) with eQ, iQ and Pablo. This development enables Quantel users to offer their customers a complete calibrated color workflow, guaranteeing predictable and repeatable results whatever the eventual display requirements.

Calibration is a straightforward process which can cover the full range of display devices from monitors to projectors. The Quantel workstation generates pre-defined color patches in sequence, which are read by a colorimeter probe, all under the control of LightSpace CMS. From this data, LightSpace generates a full profile of the display chain and produces calibration LUTs which are sent back to the Quantel workstation where they then automatically correct the output. In this way Quantel owners can guarantee their customers fully calibrated results every time.

"With the plethora of display options in use in DI, color calibration of specific display devices, and more importantly, the total workflow has become very important," said Steve Shaw, Managing Director of Light Illusion. "Being able to take ownership of calibration is vital for every facility performing high-end color grading, and I think this development will be welcomed by Quantel users."

"LightSpace gives our customers another calibration choice. Its fully automated workflow simplifies calibration, helping our customers produce consistently great quality results," said Steve Owen, Quantel director of Marketing.

LightSpace CMS is available for Quantel systems with immediate effect from Light Illusion.
